

Javascript

windows and documents Object

Document in Javascript

Document represents the document loaded inside the window or browser.

The properties related to window/document are stored in object.

Its loaded after the window is loaded because it only contains the document.

Its root element of document object model.

Its an object of an window.

we cannot access the windows objects inside the document.

Logically : `document:{properties}`.

Example `document .title` will return the title of the document.

Windows in Javascript

Windows in javascript represents the Browser window in which we see contents.

The properities related to the browser are in the window object.

Its Loaded before the window is loaded because window contains documents.

The window is the global element for all objects,functions,etc.,

we can access the document object properties inside the window.

Logically window : `{document:{properties}}`

Example `window.document .title` will return the title of the document.
